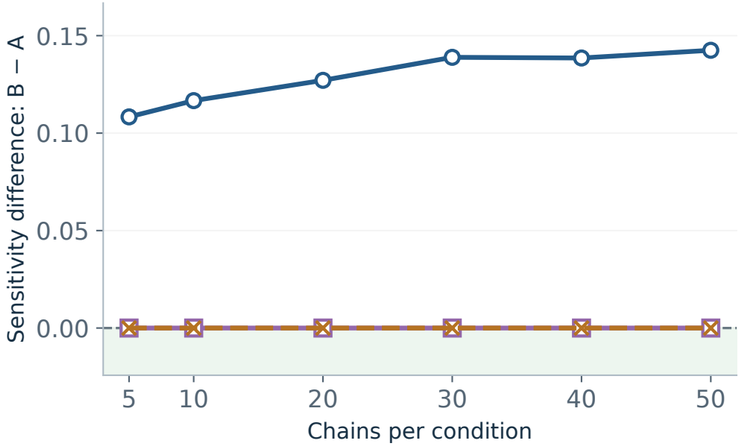
Do the H1–H4 patterns stay stable as chain count increases?

X: first k chains per condition · Y: observed condition difference · Green region: predicted direction

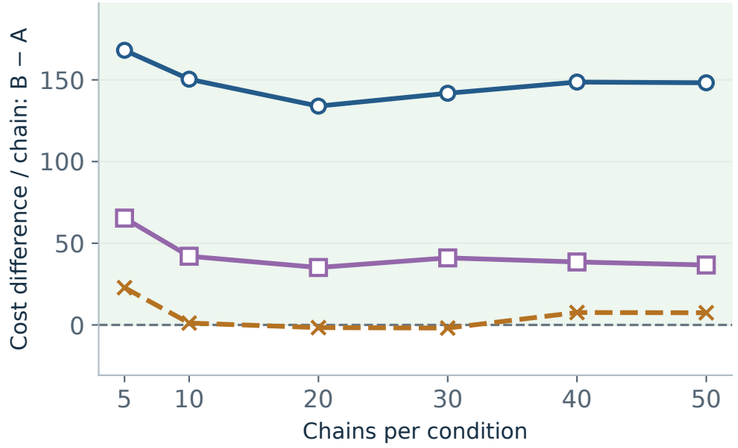
H1 Outstanding-order sensitivity

Predicted: below zero



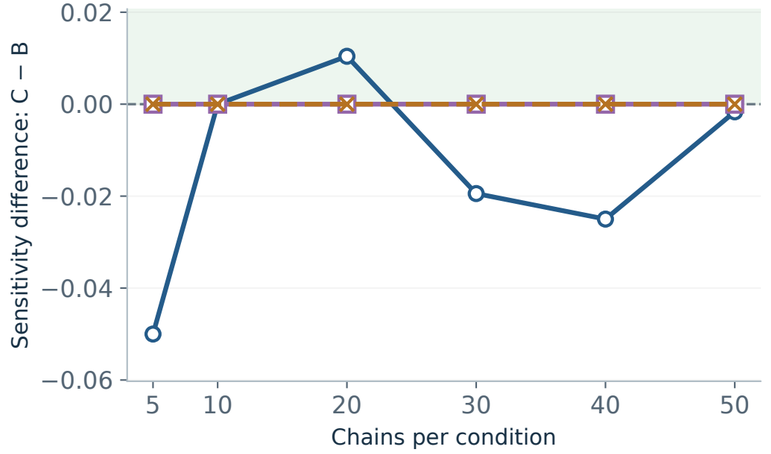
H2 Total inventory + backlog cost

Predicted: above zero



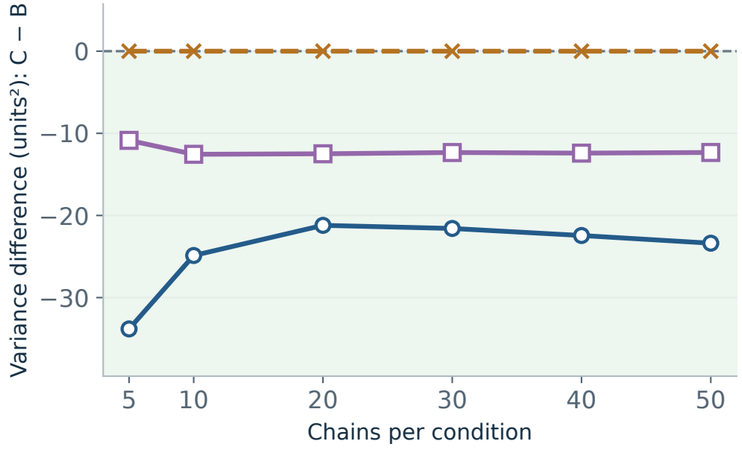
H3 Outstanding-order sensitivity

Predicted: above zero



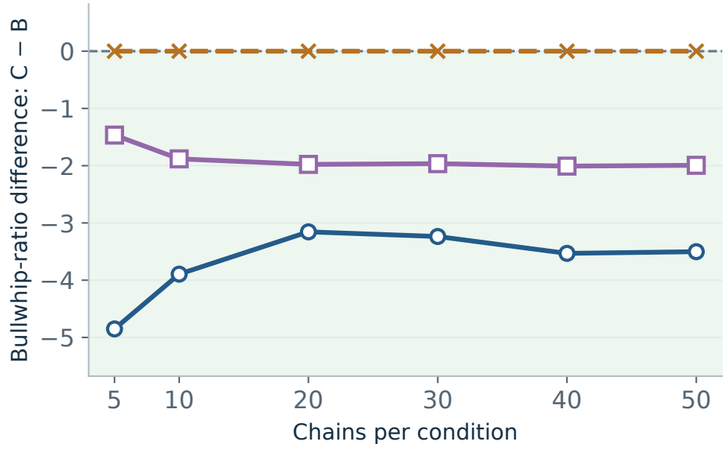
H4a Individual order variation

Predicted: below zero



H4b Bullwhip ratio

Predicted: below zero



GPT-6 Astra / run001
GPT-6.1 Sol / run001
GPT-6 Luna / run003

How to read stability

Stays on one side of zero: stable direction
Crosses zero: direction changes with size
Flat at zero: no observed difference

Sol and Luna overlap at zero for H1/H3.

A = control + revision B = control + one decision C = causal education + one decision

Provisional; transcript review pending. Each curve is ONE context with dependent chains. Direction stability is not statistical significance.
